By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         modified starches comprising the payload protein, selected from, e.g. hormones, growth factors, antibodies, enzymes, dyes, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of the waxy gene which codes for starch synthase. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hybrid polypeptide comprising starch-encapsulating region and
protein - useful for, e.g. producing protein(s) resistant to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen-synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene, involved in production of amylopectin or amylose in its original host. The method is used to produce plant-like starches by fermentation and new starches in plants. These starches are useful for all food and non-food applications of starch. The present sequence is used in
                                                                                                                                                                                                                                                                                                                              3260

                                                                                                                                                                                                                                                                                                                                                      3196
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize belta-9 desarturase. (I) can be used to modulate expression of a gene, preferably belta-9 desarturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate eaffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, heart and the contract of the contract

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ద
                                                                                                                                                                          cell line into which an apoptosis resistance gene has been introduced.

CC rise recombinant viruses generated are capable of expressing apoptosis.

CC associated genes. These can then be used in a variety of diseases for combinition of apoptosis by gene transfer, or where the cc inhibition of harmful apoptosis by gene transfer, or where the cancer cell are useful as vectors for gene therapy which can be applied to cancer cell selectively, the treatment of combinant viruses and graft rejection reaction, and apoptosis induction cell-therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of cexpressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of cell improduced to induce cell death by apoptosis is shorter than that cequired to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated cell gene. In this invention an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid pRx-ires-bsr, which contains the cowpox virus bsr gene, and cell is a paged in an example from the present invention.

Cell line into which an appotosis resistance gene has been introduced.

C The recombinant viruses generated are capable of expressing apoptosis. CC associated genes. These can then be used in a variety of diseases for CC which the induction of apoptosis by gene transfer, or where the induction of apoptosis by gene transfer, or where the CC inhibition of harmful apoptosis, is therapeutic. The recombinant viruses CC are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of CC therapy for inflammatory cells in inflammatory diseases. Prior arts have cencountered the problem where if an adenovirus vector capable of CC the cells producing the virus will be destroyed because the period of CC the cells producing the virus will be destroyed because the period of CC the cells produced to induce cell death by apoptosis is shorter than that CC cobtain a recombinant virus having the integrated apoptosis-associated GC gene. In this invention an apoptosis-resistant 293 cell line (having an CC apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the CC plasmid pRx-Bcl-xl-bsr, which contains the human Bcl-xl gene, and colleged in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

```
CC cell line into which an apoptosis resistance gene has been introduced.

CC the recombinant viruses generated are capable of expressing apoptosis.

CC associated genes. These can then be used in a variety of diseases for the induction of apoptosis by gene transfer, or where the induction of apoptosis by gene transfer, or where the cc are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of cc therapy for diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have cencountered the problem where if an adenovirus vector capable of the cells producing the virus will be destroyed because the period of the cells producing the virus will be destroyed because the period of the cells producing the virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the cowpox virus bar gene which cc is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QΥ
        The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an
                                                                                                                                                                                                                                                                                                                                                  06-APR-2000;

The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the 333 genomic sequences derived from tumour suppressor genes and
